

# Wireshark : Traffic Analysis

## NMAP Scans

Nmap is an industry-standard tool for mapping network identifying live hosts and discovering the services.

Most common Nmap scan types :

- TCP connect scans (Transmission Control Protocol) → Data Transfer
- SYN scans (Synchronize) → SYN, SYN-ACK, ACK
- UDP scans (User Datagram Protocol) connection less rely on fast queries, real time

What are TCP flags

- In every TCP packet there is a field Bit that say what kind of control message it is
- SYN : start a connection
- ACK : acknowledge received data
- RST : reset or abort a connection
- FIN : politely end a connection (normal close)

Wireshark's `tcp.flags` is often treat as an integer bitmask

$$\begin{aligned} \text{FIN} &= 1 & \text{SYN} &= 2 & \text{RST} &= 4 & \text{PSH} &= 8 & \text{ACK} &= 16 \\ &&&&&&&& \\ &&&&&\text{URG} &= 32 && \end{aligned}$$

PSH : tells the receiver (don't wait to fill buffers - deliver)  
to data as soon as possible

basically, this is to deliver to app now

URG (Urgent) : indicating there is urgent data in the stream that the receiver should treat specially

So :

- $\text{tcp.flags} == 2$  means only SYN (2)
- $\text{tcp.flags} == 16$  means only ACK (16)
- $\text{tcp.flags} == 18$  means SYN + ACK (2+16)
- $\text{tcp.flags} == 20$  means RST + ACK (4+16 = 20)

But, if we want set (every TCP packet where the SYN bit is set)

Use : -  $\text{tcp.flags.syn} == 1$  (one is indicating boolean)

This will apply all of them

- $\text{tcp.flags.ack} == 1$
- $\text{tcp.flags.reset} == 1$
- $\text{tcp.flags.fin} == 1$

If we want only SYN+ACK packet:

-  $\text{tcp.flags.syn} == 1 \& \& \text{tcp.flags.ack}$

and so on.

## TCP Connect Scans

TCP Connect Scans in nutshell:

- Relies on three way handshake
- Usually conduct with `nmap -sT`
- Used by non-privileged users
- Usually has a windows size larger than 1024 bytes as the request expect some data due to the nature of the protocol

which means:

- In TCP, each side advertises a receive window
  - bytes we are allowed to send before we must stop and wait for ACK
- For some protocols, when we make a request, we expect a non-trivial response (a chunk of data)
- Because of that, the requester or receiver will typically advertise a bigger receive window to avoid slowing things down

Open TCP ports

- $\text{SYN} \rightarrow$
- $\leftarrow \text{SYN, ACK}$
- $\text{ACK} \rightarrow$

Open TCP port

- $\text{SYN} \rightarrow$
- $\leftarrow \text{SYN, ACK}$
- $\text{ACK} \rightarrow$
- $\text{RST, ACK} \rightarrow$

Closed TCP port

- $\text{SYN} \rightarrow$
- $\leftarrow \text{RST, ACK}$

## SYN scans

TCP SYN scan in a nutshell:

- Doesn't rely on the three way handshake
- Usually conduct with `nmap -sS`
- Used by privileged users
- Usually has a size less than or equal to 1024 bytes as the request is not finished and it doesn't expect receive data

Open TCP port

- `SYN →`
- $\leftarrow$  `SYN, ACK`
- `RST →`

Close TCP port

- `SYN →`
- $\leftarrow$  `RST, ACK`

## UDP Scans

UDP scan in a nutshell:

- Doesn't require a handshake process
- No prompt for open ports
- ICMP error message for close ports
- Usually conducted with `nmap -sU`

Open UDP port

- `UDP packet →`

Closed UDP Port

- `UDP packet →`
- `ICMP Type 3, Code 3 message`

UDP scan patterns in a capture file.

$\text{icmp.type} == 3$  and  $\text{icmp.code} == 3$

TCP SYN scan patterns in capture file

$\text{tcp.flags.syn} == 1$  and  $\text{tcp.flags.ack} == 0$  and  $\text{tcp.window\_size} \leq 1024$

Same but  $\text{tcp.window\_size} > 1024$  in TCP Connect Scan

Question:

- What is the number of the TCP Connect scans?

$\text{tcp.flags.syn} == 1$  and  $\text{tcp.flags.ack} == 0$  and  $\text{tcp.window\_size} > 1024$

- Which scan type is used to scan the port TCP port 80?

$\text{tcp.port} == 80$  (and followed the pattern)

- How many 'UDP close port' messages are there?

$\text{icmp.type} == 3$  and  $\text{icmp.code} == 8$

- Which UDP port in the 55-70 port range is open?

$\text{udp} \& \text{ udp.dstport} \geq 55 \& \text{ } \text{udp.dstport} \leq 70$
